

Today, we unlocked machine payments for inference.

Agents can now pay for intelligence as they use it.

MADE POSSIBLE BY MONAD

Inference is becoming the new compute market.

NVIDIA says agentic AI turns inference into always-on work: reasoning, planning, tool use, retrieval, code, and action.

GLOBAL AI INFRASTRUCTURE SPEND

\$153B to \$1T+

USD BILLIONS

10x

NVIDIA: inference token generation surged in one year.

1M x

NVIDIA: GPU compute demand increased 1M x over the last few years.

\$75.2B

NVIDIA Data Center revenue in Q1 FY27, up 92% year over year.

THE PROBLEM TODAY

Machine payments break inference latency.

300ms TTFT is the benchmark agents still expect. Traditional auth, billing, and DB lookups eat the budget. Machine payments blow past it.

TIME TO FIRST TOKEN

300ms is the benchmark

IMPACT ON TTFT

01

Settlement risk

If the agent signs first, the provider can fail to deliver. If the provider serves first, the agent can fail to pay.

02

Wrong payment shape

Current x402 / MPP session and streaming flows force one side to trust the other. Inference needs per-request certainty.

03

No anonymous compute

Providers need to know who is accessing inference and enforce policy when usage turns harmful.

Monad states become inference stages.

We turned payment confirmation into a staged compute permission system: confirm-to-compute.

confirm-to-compute: Proposed → prefill. Voted → first token.

MONAD TRANSACTION STATE

MAPS TO INFERENCE STATE

PROVIDER ACTION

CONFIRM-TO-COMPUTE

Speculate safely

Proposed unlocks preparation, not token delivery.

Confirm-to-compute

Voted / safe is where payment state becomes compute permission.

Settle later

Finalized and Verified handle accounting after the UX moment.

THE FLOW WE CREATED

MPP-I turns Monad transaction states into an inference pipeline.

Instead of waiting for payment to finish, the provider advances compute as the payment becomes safer.

CURRENT PAYMENT SYSTEMS TREAT PAYMENT AS A PRECONDITION. MPP-I TREATS MONAD STATE AS A STAGED COMPUTE PERMISSION SYSTEM.

WHAT WE BUILT TODAY

MPP-I: Machine Payments Protocol for Inference.

Native to Monad. Built for Ando as the inference provider. Designed for payment, identity, and speed.

Inference-native

Payment is staged around TTFT, streaming, and metered usage.

Monad-native

latest, safe, finalized, and verified become risk states for compute.

Ando-integrated

MPP-I connects directly into Ando's inference path as the provider side of the rail.
